> If you are helping someone that is currently WFH that does not have access to GovWifi, please click here to be redirected.

Install Google Authenticator on your phone

Go to the App store/Play store on your phone and install google authenticator. Once you have done that, tap on the + in the upper right corner or click on manual entry, to add a new account. Add the code provided in your email into the Key field and name your account to something recognisable.

You should now see an account with whatever name you provided in the Authenticator app. It will have a number underneath and a countdown timer. This is a one-time code that expires every 60 seconds and it is replaced by a new code. You will need one of these codes every time you want to log into the VPN.

For a step by step guide please follow: Google Authenticator

In order to access a number of the resources and services within the Cloud, users are required to use a **V irtual Private Network** (henceforth VPN) in order to be allowed to view these resources. A VPN creates a secure link between your computer and the cloud, protecting your data from outside influences.

Setting up these resources without assistance requires a high level of subject specific technical knowledge, as such this guide was created in order to aid users in gaining access to the VPN and begin working.

This is necessary to the business in order to ensure only valid users with the correct security clearance have access to our resources.

> **Time Taken**
>
> Assuming no obstacles, this guide should take between 30-60 minutes to complete depending on what software you already have installed and your wifi speed. This does not need to be done continuously and can be broken up.

Table of Contents

- Install Google Authenticator on your phone

Gaining the right level of access using LDAP
- Login to PASS
- Generate a GPG key
- Input your key into PASS
- Decrypt the email attachments

Accessing the VPN
- Install Google Authenticator on your phone
- Install OpenVPN
- Download the Relevant VPN bundle
- Log in to the VPN
